PROJECT DOCUMENTATION

TEAM ID	**SWTID-2026-9609**
PROJECT TITLE	**AUTOMATING EMPLOYEE DATA**

1 INTRODUCTION

1.1 Project Overview

The Automating Employee Data project focuses on simplifying the process of managing employee information using the ServiceNow platform.

In many organizations, employee data such as name, email, department, and manager details are often entered manually while creating incident records.

This manual process can lead to errors and consume more time. This project demonstrates how employee data can be imported into the system and automatically displayed in the incident form.

By using ServiceNow features like Import Sets, Transform Maps, and dot walking, the system can automatically retrieve employee details without manual entry. This improves efficiency and reduces the chances of errors.

1.2 Purpose

The purpose of this project is to automate employee data management and improve the incident creation process in ServiceNow.

The main goals of this project include:

- Automating the import of employee data into the system
- Reducing manual data entry during incident creation
- Improving data accuracy and reliability
- Automatically displaying employee information such as department and manager
- Improving efficiency in incident management

2 IDEATION PHASE

2.1 Problem Statement

In many organizations, employee information is not automatically available during incident creation. Service desk agents often need to manually search for employee details such as department, email, or manager information. This manual process takes time and increases the possibility of errors.
Therefore, there is a need for a system that can automatically import employee data and display relevant details during incident creation. Automating this process will reduce manual effort and improve overall workflow efficiency.

2.2 Empathy Map Canvas

The empathy map helps understand the needs and challenges faced by users who manage incidents in an organization.
Users often feel frustrated when they have to manually search for employee details while creating incidents. They expect the system to provide accurate information quickly. They also want the system to reduce repetitive tasks and improve productivity.
Users think that automation will simplify their work and help them resolve incidents faster. They want a reliable system that provides correct employee details without requiring additional manual steps.
The system designed in this project addresses these concerns by automatically displaying employee information using ServiceNow features.

2.3 Brainstorming

During the brainstorming phase, several ideas were considered to solve the problem of manual employee data entry. One possible solution was to create a system that could automatically import employee data from an external source and store it in the ServiceNow database.
Another idea was to use reference fields in the incident form so that selecting an employee would automatically retrieve related information such as department and manager details. This approach would reduce manual work and make the incident creation process more efficient.
After evaluating different ideas, the final solution selected was to automate employee data import using Import Sets and Transform Maps and retrieve related information using dot walking.

3 REQUIREMENT ANALYSIS

3.1 Customer Journey Map

The customer journey describes how users interact with the system during incident creation. Initially, the user logs into the ServiceNow platform and opens the incident form. When an employee is selected in the reference field, the system automatically retrieves related employee information.
This automated process helps the user quickly access required data and create incident records efficiently.

3.2 Solution Requirement

The system requires the following components to function effectively:
ServiceNow platform for system configuration
Employee data source such as Google Sheets
Import Sets for uploading external data
Transform Maps for data transformation
Incident module for testing automation
These components work together to automate employee data management.

3.3 Data Flow Diagram

The data flow begins with employee data prepared in Google Sheets. This data is uploaded into ServiceNow using the Import Sets module. The imported data is stored in a staging table. Using Transform Maps, the data is moved to the User table where employee records are stored permanently.
When an incident is created, selecting an employee automatically retrieves related information such as department and manager details.

3.4 Technology Stack

The technology used in this project includes:
ServiceNow platform for system configuration
Google Sheets for preparing employee data
Import Sets for data import
Transform Maps for data transformation
Incident Management module for testing automation

4 PROJECT DESIGN

4.1 Problem Solution Fit

The proposed solution directly addresses the problem of manual employee data entry. By automating the import process and linking employee records to incident forms, the system reduces the need for manual data lookup.

4.2 Proposed Solution

The proposed solution involves importing employee data into ServiceNow and storing it in the user table. When creating an incident, selecting an employee automatically retrieves related information such as department and manager details.
This solution improves efficiency and ensures that accurate information is available during incident management.

4.3 Solution Architecture

The system architecture consists of multiple stages. First, employee data is prepared in Google Sheets. The data is then uploaded into ServiceNow using Import Sets. Transform Maps are used to move the data to the user table. Finally, the incident form retrieves employee information automatically using dot walking technique.

5 PROJECT PLANNING & SCHEDULING

5.1 Project Planning

The project was planned in several stages including data preparation, data import, system configuration, testing, and final demonstration. Each stage was completed step by step to ensure the system works correctly.

6 FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

The system was tested by creating incident records and selecting employee names from the reference field. The system successfully displayed department, email, and manager details automatically. This confirmed that the automation works correctly.

7 RESULTS

The project successfully demonstrated automation of employee data management.

Employee records were imported into ServiceNow and the incident form automatically displayed related employee information.

Dictionary Entry Priority

Create Choice List Update

A dictionary entry manages how ServiceNow stores data in tables and fields (columns). For new dictionary entries, select a **Table** and the field **Type** of the new column. Also enter a column label, which becomes the field label, and the column name. If necessary, set a **Max length** for text String type fields, make the field **Mandatory** to save a record, and make the field a Display Value for reference fields so it appears on records that reference this table. 8 ADVANTAGES & DISADVANTAGES

Advantages

- Reduces manual data entry
- Improves data accuracy
- Saves time during incident creation
- Enhances workflow efficiency

Disadvantages

- Requires initial system configuration
- Dependent on correct data import

9 CONCLUSION

The Automating Employee Data project demonstrates how ServiceNow can be used to automate employee information management and improve incident handling processes.
By importing employee data and using automation features like dot walking, the system can retrieve relevant information automatically.
This project reduces manual work, improves data accuracy, and enhances the efficiency of incident management.

10 FUTURE SCOPE

In the future, the system can be enhanced by integrating additional modules such as employee self-service portals and automated notifications. The system can also be extended to include advanced workflow automation and reporting features.
